

Model Management frontend

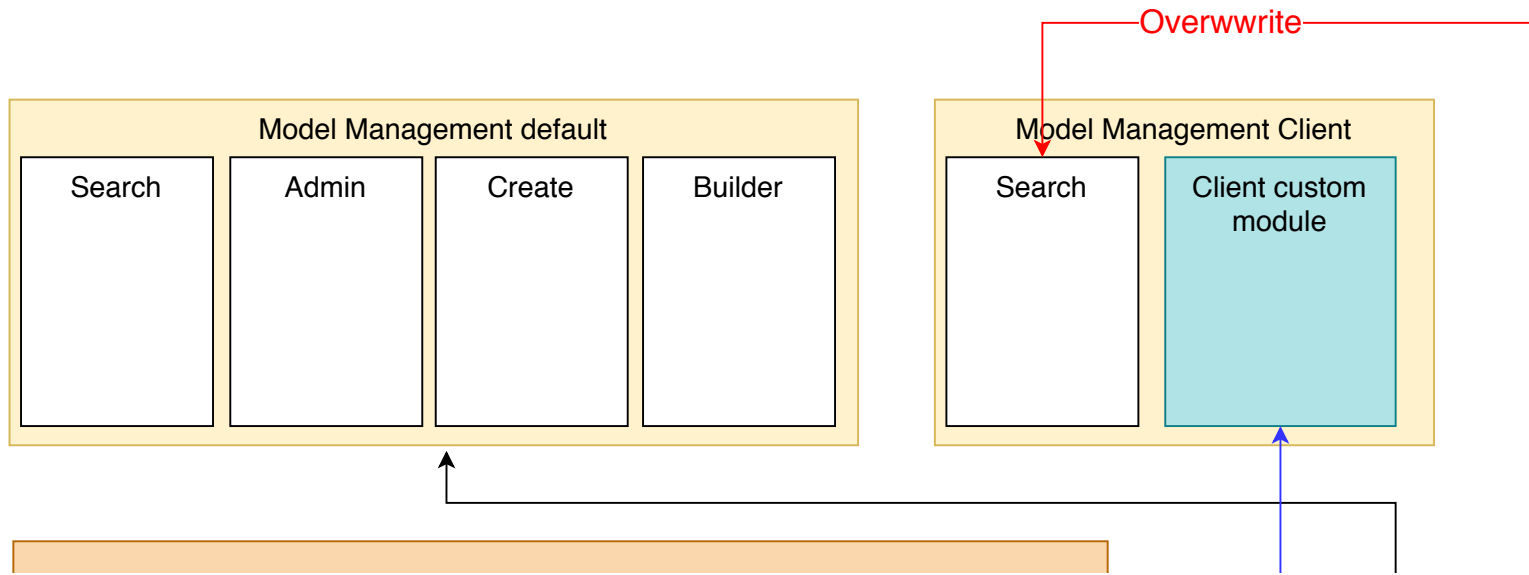

Current

Problems

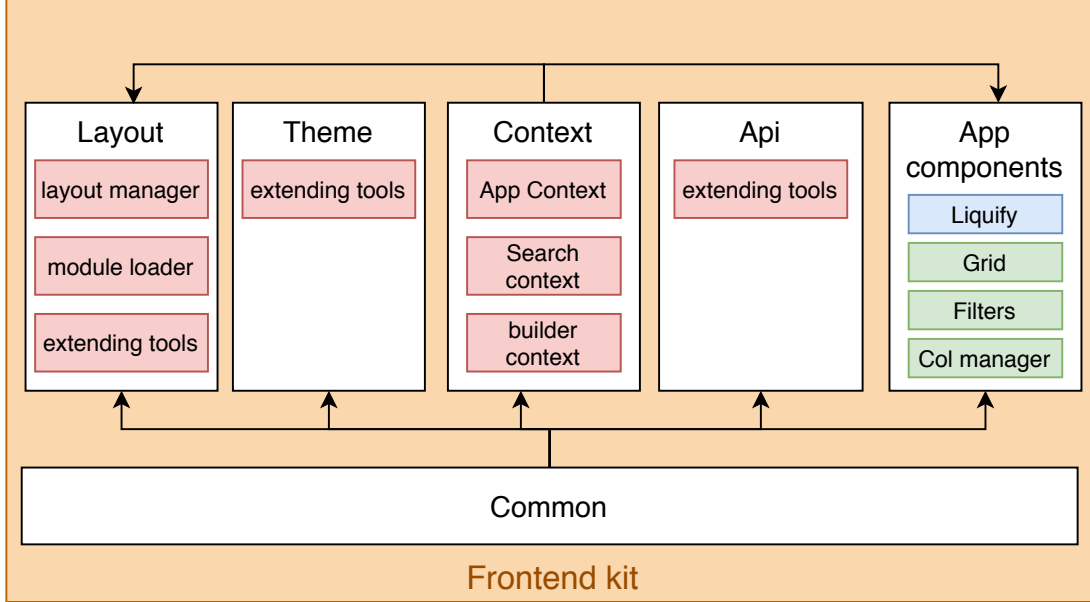

- web package contain all the app logic make it difficult to extend from client without changing the source code.
- the api package does not contain any tools to manipulate queries.
- there is no way to manipulate or extend any context.
- changing the app is possible but there is no way to change it without creating it in the main app

solution

Benefits

- build feature modules based on utilities packages that can be imported on demand to build feature.
- client can build their own packages using the utilities packages
- client can overwrite default package and implements their

New

package and implements their own logic or even layout.

Possible problems

- every component need to expose an api to customize it.
- there is no way to extend default modules without overwriting it.
- in case of default module overwrite client will have access to module source code.
- ci/cd need to be set in order to deploy client changes.
